

How I created a
Chrome Extension
with **0** coding skills
using **ChatGPT**

...in **15** minutes

>>>
Swipe

Step 1: Define the purpose of your extension

"I want my Chrome Extension to tell me the colour code of any element on any website."

Step 2: Ask ChatGPT to write the code

- Detail the exact features you want
- Ask for separate code-files and their names

DA

write me the code for a Chrome Extension that helps me identify the colour code of any element on any website with these features:

- when the extension is clicked, a window pops up
- in the window I can see the instructions on how it works
- in the window there is also button, which turns my mouse into a magnifying glass when clicked
- with the mouse-magnifying glass, I can click on any element on the webpage and the colour code of it will show up in the pop-up window

give me each file separately and with their names

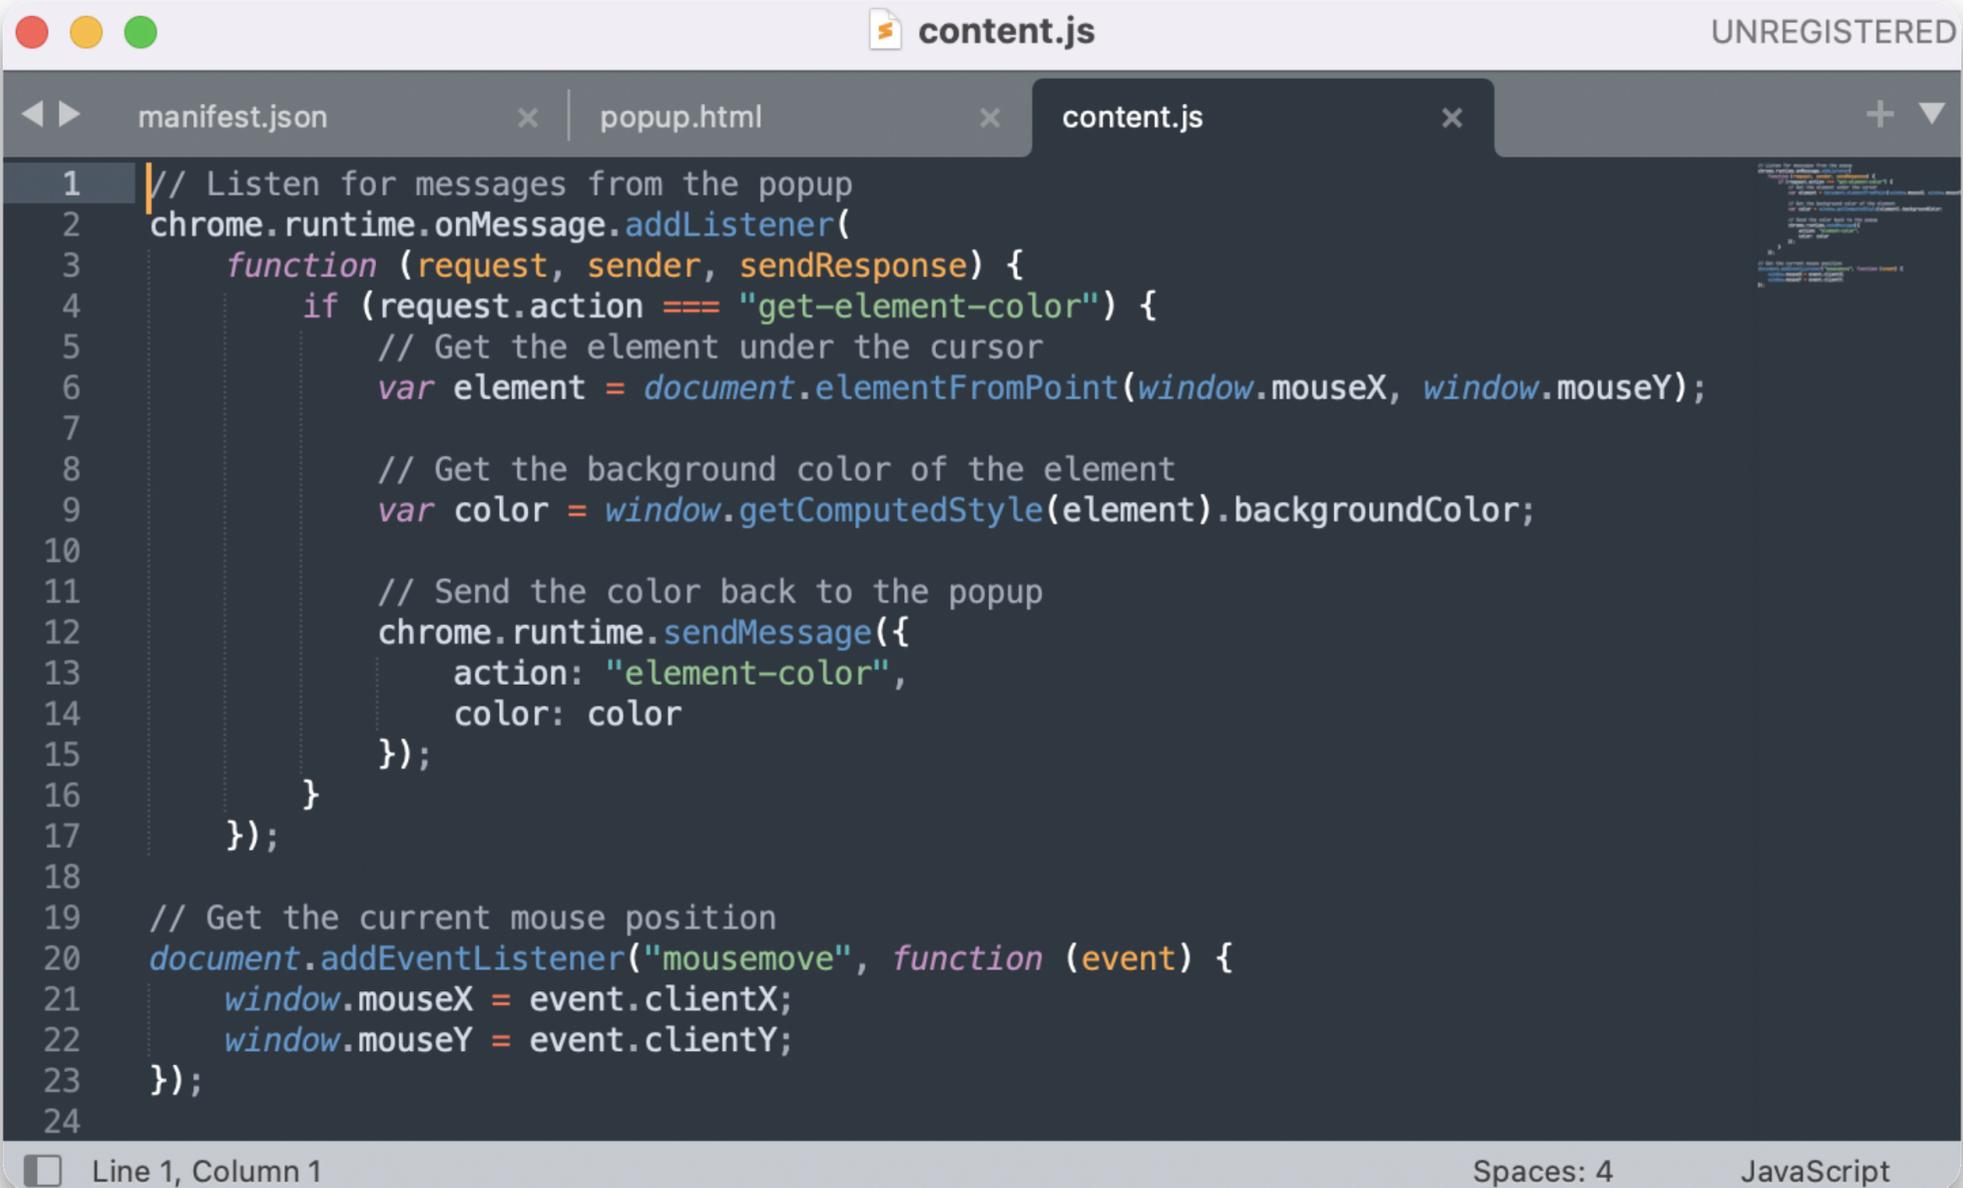

Here is the code for each file of the Chrome Extension:

- you will get several files, such as *manifest.json*, *content.js*, *popup.html* etc.

Step 3: Paste the code into Sublime Text

- Download the free app “ Sublime Text”
- Paste each code snippet into a separate tab

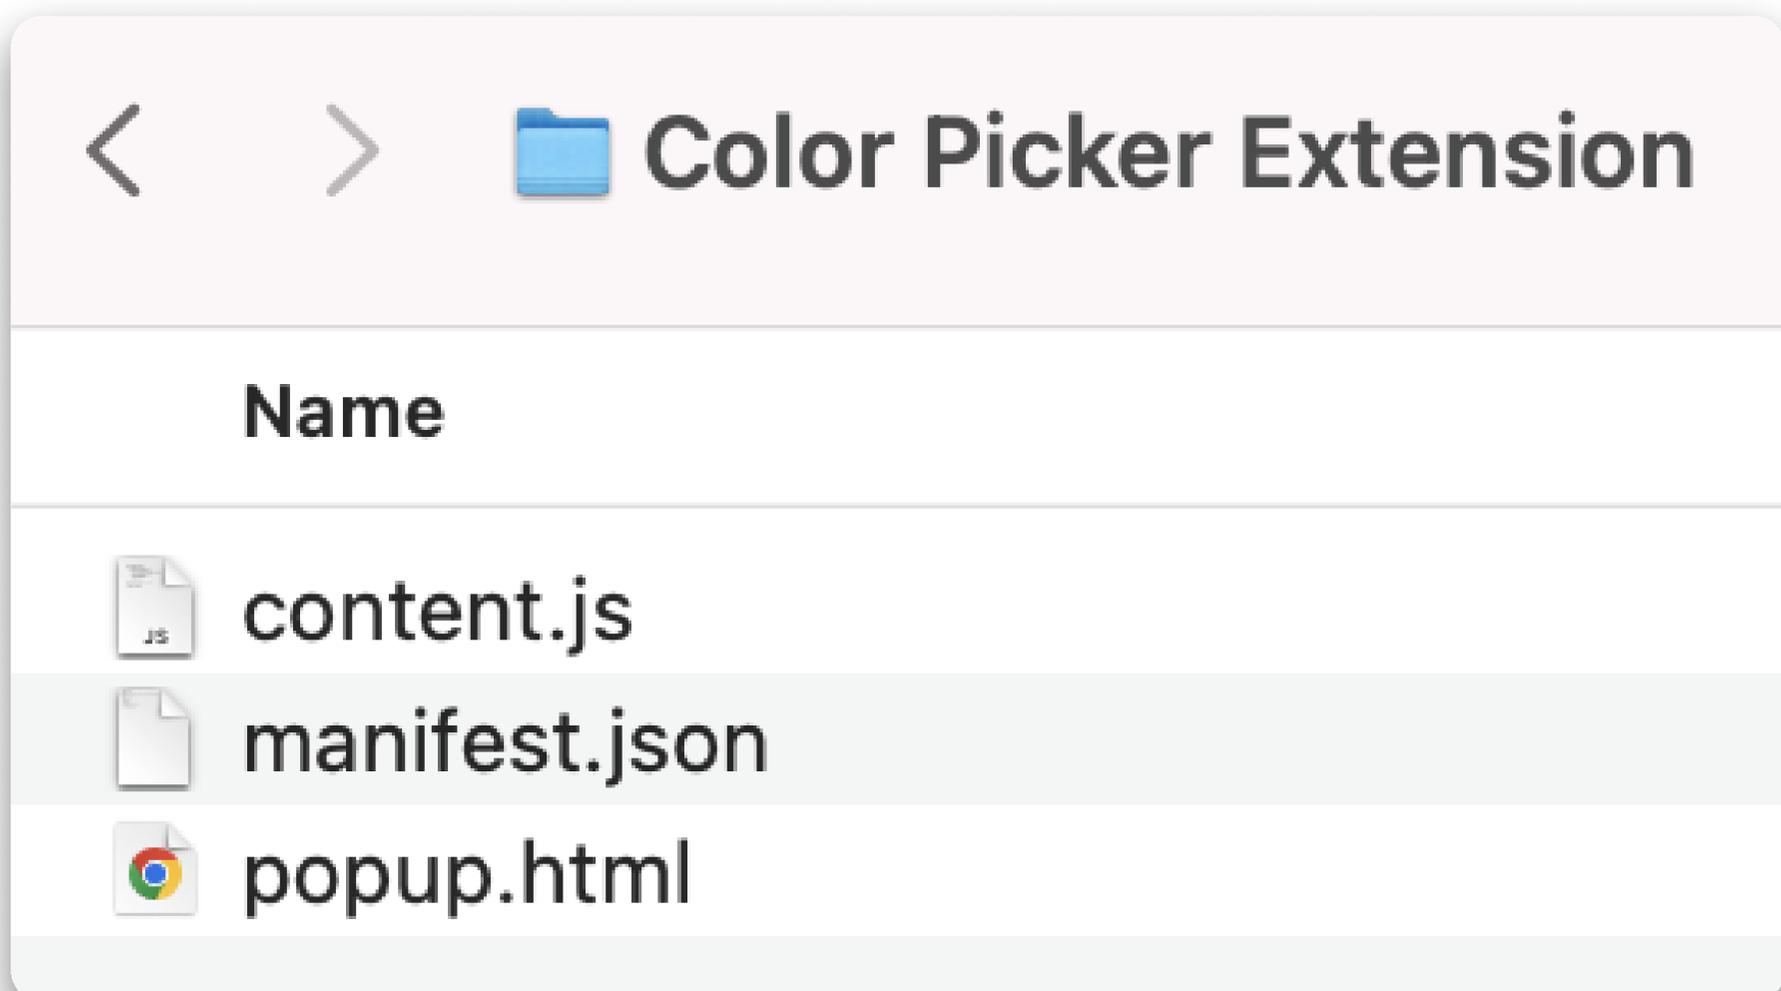

```
1 // Listen for messages from the popup
2 chrome.runtime.onMessage.addListener(
3     function (request, sender, sendResponse) {
4         if (request.action === "get-element-color") {
5             // Get the element under the cursor
6             var element = document.elementFromPoint(window.mouseX, window.mouseY);
7
8             // Get the background color of the element
9             var color = window.getComputedStyle(element).backgroundColor;
10
11             // Send the color back to the popup
12             chrome.runtime.sendMessage({
13                 action: "element-color",
14                 color: color
15             });
16         }
17     });
18
19 // Get the current mouse position
20 document.addEventListener("mousemove", function (event) {
21     window.mouseX = event.clientX;
22     window.mouseY = event.clientY;
23 });
24
```

Line 1, Column 1 Spaces: 4 JavaScript

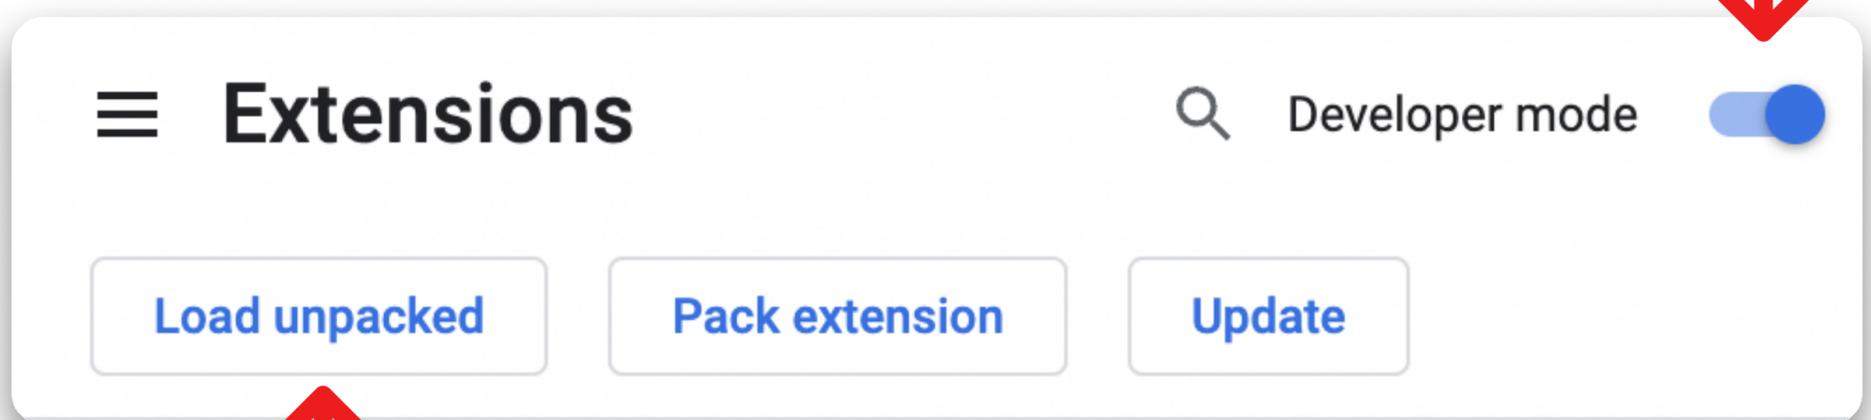

Step 4: Save all code-files

- Create a new folder on your laptop
- Name it as you wish (*won't affect your extension*)
- Save all the code-files here

Step 5: Upload your extension

- Go to <chrome://extensions/>
- Turn on “Developer mode”
- Click on “Load unpacked”
- Select the folder with all the code files

Step 6: Update/fix your extension

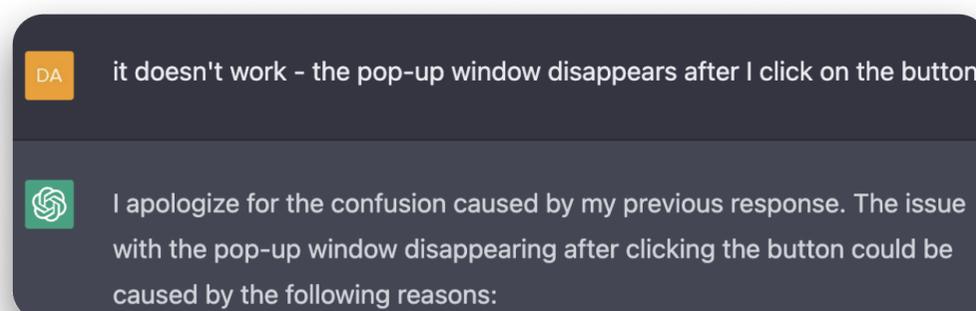

→ Your extension is ready, time to test it!

→ There is a problem?

- write ChatGPT: “it doesn’t work -” + the issue

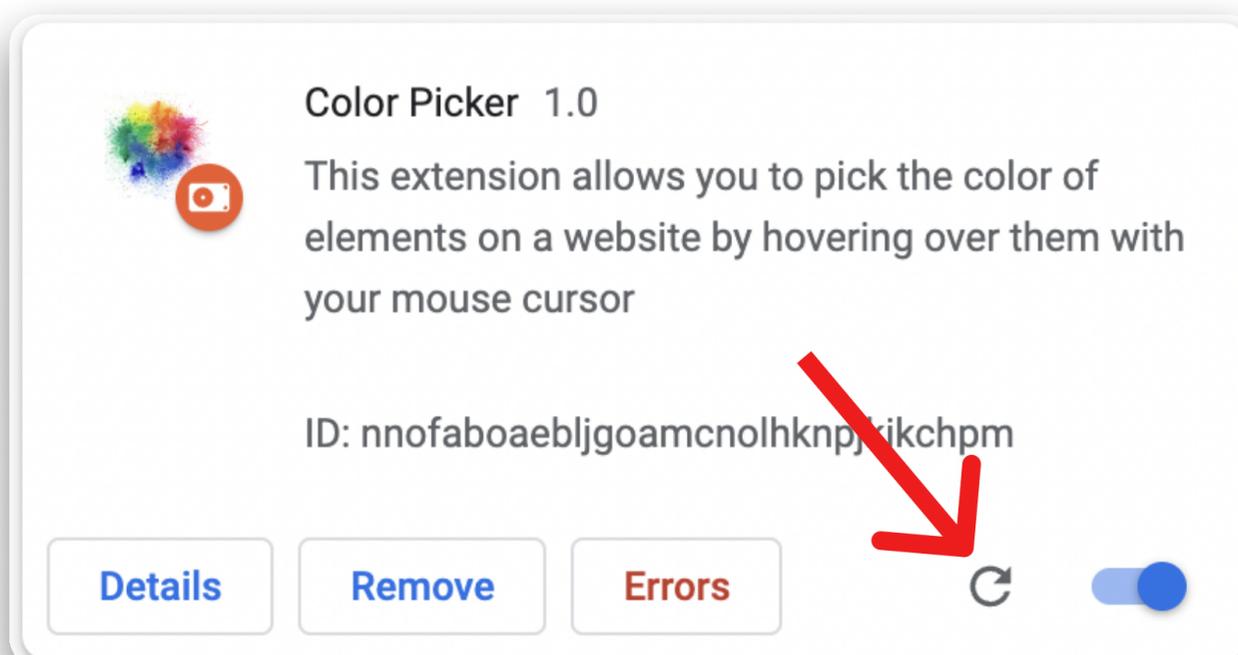

→ You want to update something?

- write ChatGPT: “rewrite my code with...”

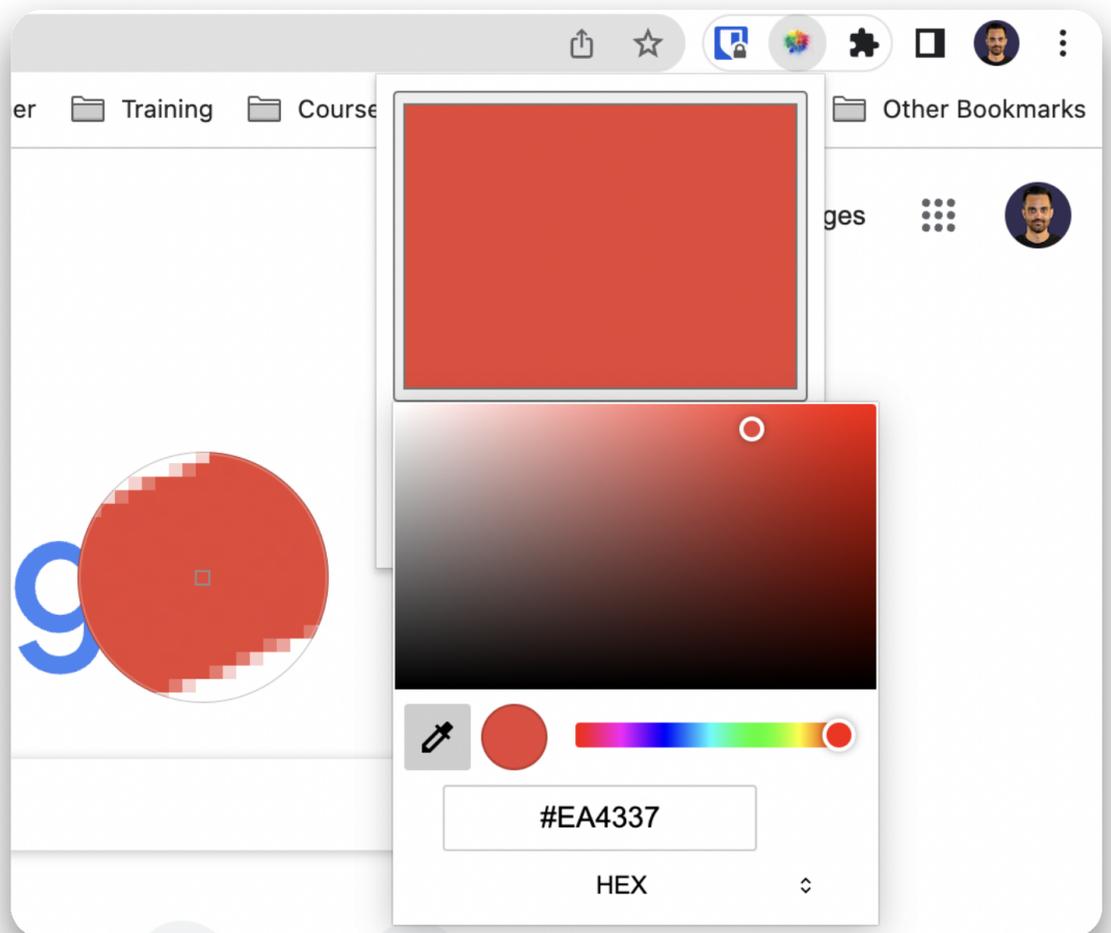

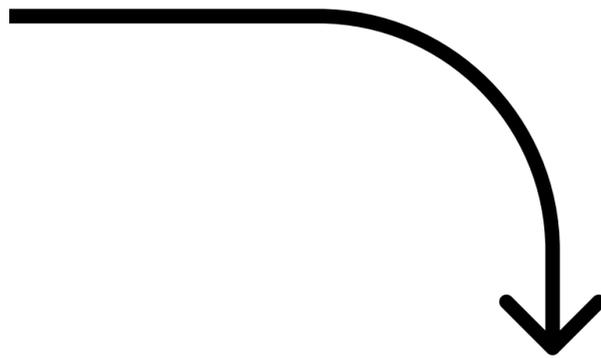

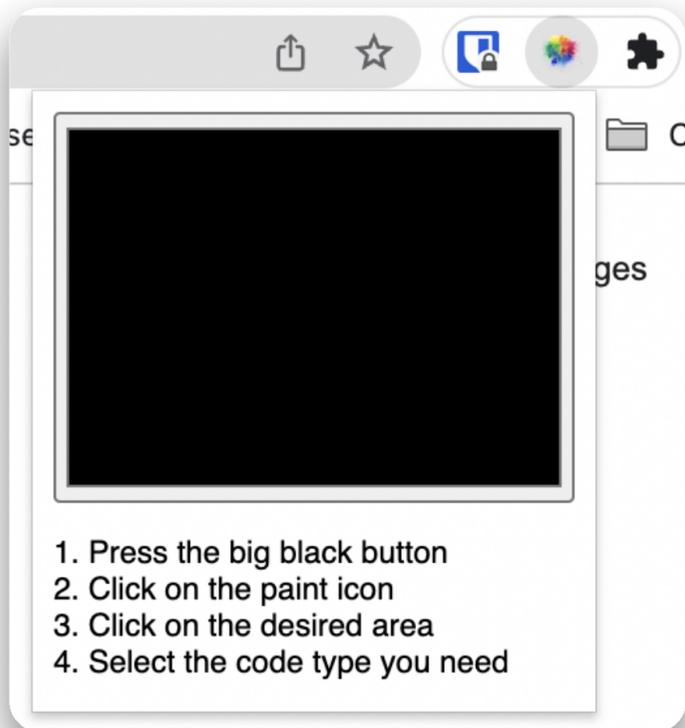

→ Update your code in Sublime Text

→ Refresh your Chrome Extension

→ Repeat it until you’re satisfied with the extension

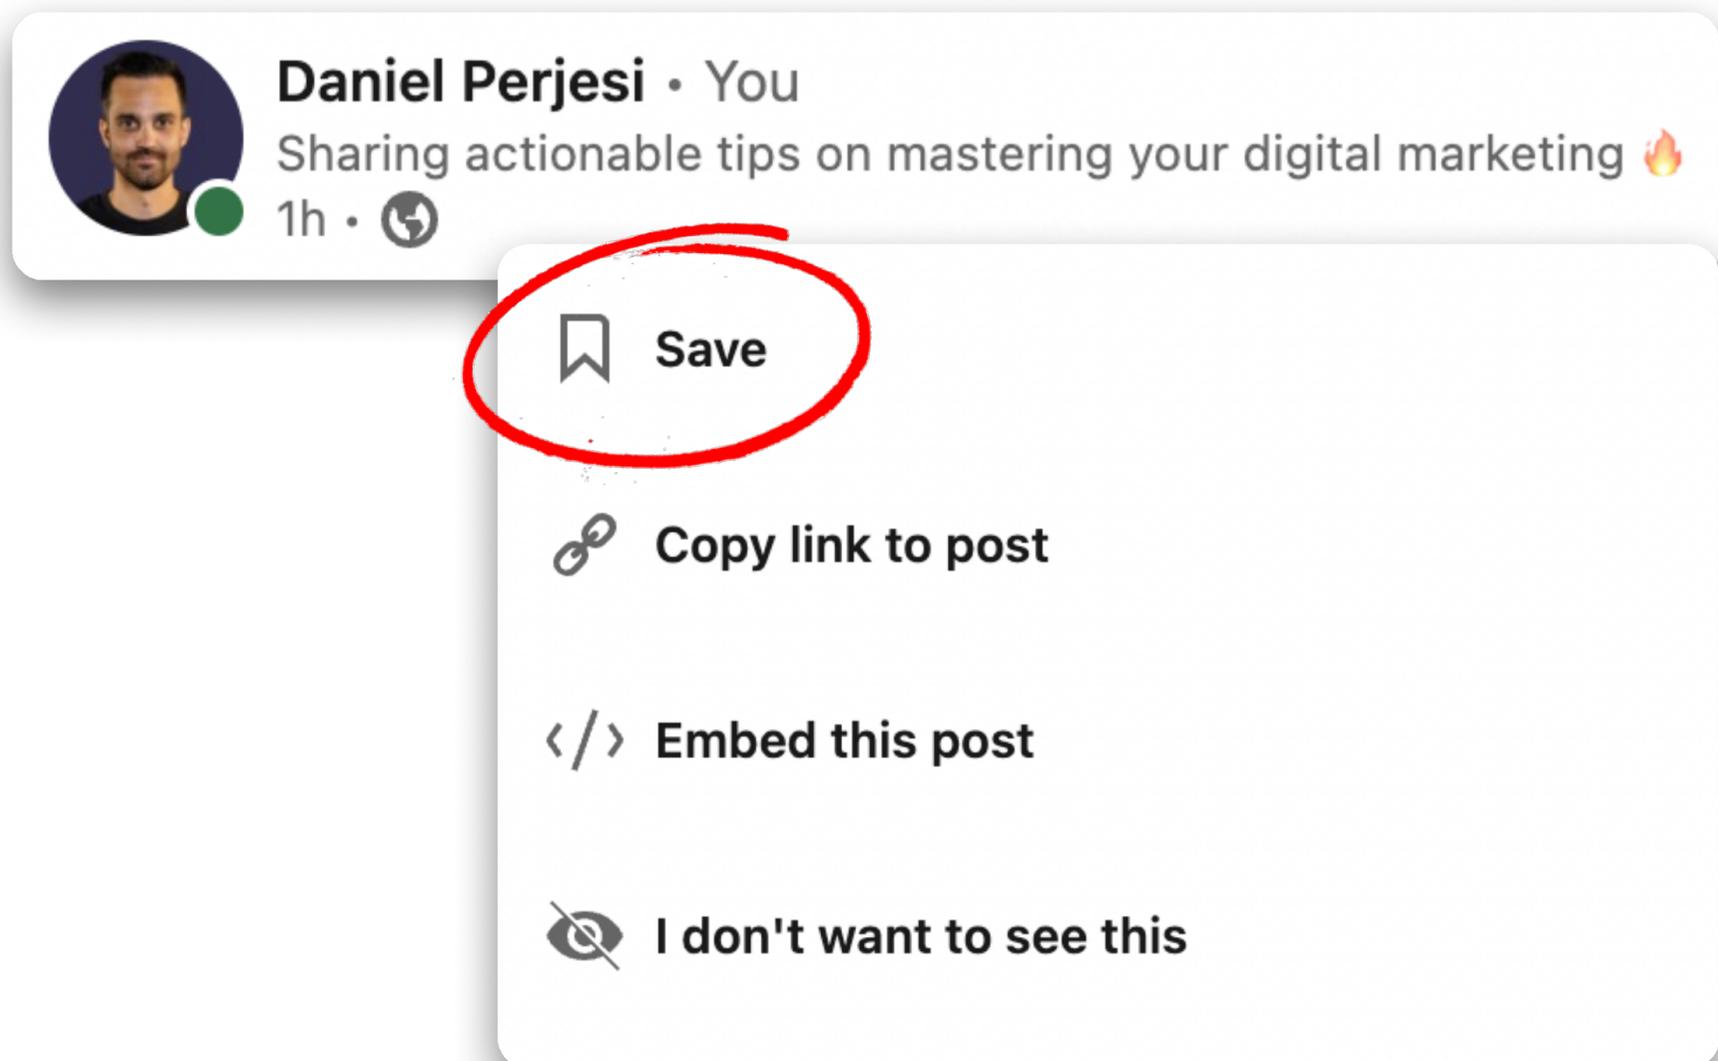

The result?

Time spent: **15mins**
